

FIRESHIELD COATINGS

GROUP 1 PROTECTION – CLEAR COATINGS

Fireshield is an intumescent coating in clear or solid colour that reacts to heat, swelling and charring to prevent the spread of flames throughout the building.

Application of clear Fireshield on timber takes the group rating from Group 3 to Group 1 as allowed under the NCC Performance Solutions.

This allows the natural beauty of timber to be showcased with a clear coating whilst still achieving the fire rating required.

Although Fireshield can be applied on site it is often impractical to do so as strict environmental and application controls are required and the product has a long drying time.

The best approach is to apply the coating in a factory environment and then install the pre-coated components on site.

This approach is more cost effective, but more importantly ensures the correct application and finish quality is achieved under controlled conditions.

Our coaters have become experts in the application of Fireshield, are fully certified and regularly apply the product on a range of products including battens, lining boards & claddings.

There are a wide range of stains and finishes available in both clear coats and solid colours.

We deliver the product ready to install with full documentation, eliminating site down time and ensuring a quality finish.

Talk to us whenever you want to showcase timber but need a Group 1 rating.
